Big-Oh Running Time (asymptotic upper bound)

$f(n) = O(g(n))$ if there exists a constant $c > 0$ and a constant n_0 such that for every $n \geq n_0$ we have $f(n) \leq cg(n)$.

Example

Prove that $n^3 = O(7n^2 + \frac{n^3}{3})$: We need to find c, n_0 such that $\forall n \geq n_0$:

$$n^3 \leq c(7n^2 + \frac{n^3}{3})$$
$$c = 3$$

Example

Prove that $n^3 = O(\frac{n^3}{3} - 7n^2)$: We need to find c, n_0 such that $\forall n \geq n_0$:

$$n^3 \geq c(\frac{n^3}{3} - 7n^2)$$

We can take $c = 6$, then we want to show that:

$$n^3 \leq 6(\frac{n^3}{3} - 7n^2) \quad \forall n \geq n_0$$
$$n^3 \leq 2n^3 - 42n^2$$
$$42n^2 \leq n^3$$
$$42 \leq n$$

Thus, this inequality holds for $n_0 = 42$.

Example

Prove that $\log_{10} n = O(\log n)$ and that $\log n = O(\log_{10} n)$: We need to find c, n_o such that $\forall n \geq n_o$:

$$\begin{aligned}\log_{10} n &\leq c \log_2 n \\ \log_{10} n &= \frac{\log_2 n}{\log_2 10}\end{aligned}$$

We can take $c = \frac{1}{\log_2 10}$ and $n_o = 1$.

Example

What about 3^n and 2^n ?

$$\begin{aligned}2^n &= O(3^n) \\ 2^n &\neq O(2^n)\end{aligned}$$

For this case, we need to show that for every possible c and every possible n_o , the equality is false. By contradiction, assume that $3^n = O(2^n)$. If this is the case, then there exists constants c and n_o such that 3^n is upper bounded by $c \cdot 2^n$.

$$3^n \leq c \cdot 2^n \quad \forall n \geq n_o$$

Divide both sides by 2^n :

$$\left(\frac{3}{2}\right)^n \leq c$$

This cannot possibly hold as $n \rightarrow \infty$ because $\frac{3}{2} > 1$ and the function is exponential.

Big-Omega Running Time (asymptotic lower bound)

$f(n) = \Omega(g(n))$ if there exists a constant $c > 0$ and a constant n_o such that for every $n \geq n_o$ we have $f(n) \geq cg(n)$. This is the reverse of Big-Oh and determines a lower bound. Claim: any comparison-based sort of n numbers needs at least $\Omega(n \log n)$ comparisons.

Theta Running Time (asymptotically tight bound)

$f(n) = \Theta(g(n))$ if there exists constants $c_1, c_2 > 0$ and a constant n_0 such that for every $n \geq n_0$ we have $c_1g(n) \leq f(n) \leq c_2g(n)$.

$$\log n = \Theta(1 + \log n)$$

$$n^3 = \Theta(7n^2 + \frac{n^3}{3})$$
