## Quadric Surfaces

Quadric surfaces are surfaces that can be described by quadratic equations in  $\mathbb{R}^3$ .

$$ax^2 + by^2 + cz^2 + dxy + exz + fyz + gx + iy + hz = j$$

We will only consider the cases where the coefficients  $d, e, f$  are zero and there are no mixed variables.

### Example

Sketch  $z = x^2 + 4y^2$ . Trace:

$$\begin{array}{cccc} z = 0 & z = 1 & z = 5 & z = -1 \\ 0 = x^2 + 4y^2 & 1 = x^2 + 4y^2 & 5 = x^2 + 4y^2 & -1 = x^2 + 4y^2 \end{array}$$

Starting from  $z = 0$ , this figure is a single point and expands as a series of ellipses along the positive  $z$  axis. If we take a slice along the  $yz$ -plane:

$$\begin{array}{l} x = 0 \\ z = 4y^2 \end{array}$$

**Example**

Sketch  $x^2 + 4y^2 + 9z^2 = 9$ :

$$\begin{array}{ccccccc}
 z = 0 & z = \pm \frac{1}{3} & z = \pm 1 & x = 0 & & & \\
 x^2 + 4y^2 = 9 & x^2 + 4y^2 = 8 & x^2 + 4y^2 = 0 & 4y^2 + 9x^2 = 9 & & & 
 \end{array}$$

This shape is ellipsoidal along the xy-plane.

**Example**

Sketch  $x^2 - 4y^2 + 9z^2 = 9$ :

$$\begin{array}{ccccccc}
 y = 0 & y = \pm 1 & y = \pm 5 & z = 0 & & & \\
 9 = x^2 + 9z^2 & 10 = x^2 + 9z^2 & 109 = x^2 + 9z^2 & x^2 - 4y^2 = 9 & & & 
 \end{array}$$

This shape looks like a series of expanding ellipses starting from  $y = 0$ . It is a hyperboloid.

**Example**

Sketch  $x^2 - 4y^2 - 9z^2 = 9$ :

$$\begin{array}{ccccccc}
 x = 0 & x = \pm 3 & x = \pm 5 & x = \pm 8 & x = 0 & & \\
 \emptyset & 0 = 4y^2 + 9z^2 & 15 = 4y^2 + 9z^2 & 40 = 4y^2 + 9z^2 & x^2 - 4y^2 = 9 & & 
 \end{array}$$

This shape is a hyperboloid of two sheets.

### Example

Sketch  $z^2 = x^2 + 4y^2$ :

$$\begin{aligned} z = 0 & & x = \pm 1 \\ 0 = x^2 + 4y^2 & & 1 = x^2 + 4y^2 \end{aligned}$$

This is a series of expanding ellipses starting from  $z = 0$ . If we take  $x = 0$ , we get  $z^2 = 4y^2$ , which represents two intersecting lines or the cross section of the ellipses. We know from this that the radii of the ellipses increase linearly.
